

What is Shockwave Therapy?

Shockwave is an FDA cleared, non-invasive treatment that uses pressure waves to stimulate metabolism, enhance blood flow and accelerate healing that gradually regenerates and eventually heals damaged tissue.

What to expect during treatment?

Generally sessions take about 5-10 minutes. Then, the Shockwave wand is used to deliver pressure waves in a circular manner over the affected area.

How soon will I feel the results?

Some patients report immediate pain relief but it can take up to 4-6 weeks for pain relief to begin. The effects of the treatment are cumulative; therefore expect to see improvements as you proceed through the treatment plan. 80% of patients report resolution of pain or have a significant pain reduction.
